

THIRD EDITION

COMPUTER SYSTEMS

A PROGRAMMER'S PERSPECTIVE

BRYANT • O'HALLARON

Table of Contents

Introduction	0
Chapter 1: A Tour of Computer Systems	1
1.9 Import Themes	1.1
Part I: Program Structure and Execution	2
Chapter 2: Representing and Manipulating Information	2.1
Chapter 3: Machine-Level Representation of Programs	2.2
Chapter 4: Processor Architecture	2.3
Chapter 5: Optimizing Program Performance	2.4
Chapter 6: The Memory Hierarchy	2.5
Part II: Running Programs on a System	3
Chapter 7: Linking	3.1
Chapter 8: Exceptional Control Flow	3.2
Chapter 9: Virtual Memory	3.3
Part III: Interaction and Communication between Programs	4
Chapter 10: System-Level I/O	4.1
Chapter 11: Network Programming	4.2
Chapter 12: Concurrent Programming	4.3
Appendix A: Error Handling	5
A.1: Error Handling in Unix Systems	5.1
A.2: Error Handling in Wrappers	5.2

Personal solutions for Computer Systems: A Programmer's Perspective 3rd edition.

Chapter 1: A Tour of Computer Systems

- [1.9 Import Themes](#)

1.9 Import Themes

Practice Problem 1.1

Suppose you work as a truck driver, and you have been hired to carry a load of potatoes from Boise, Idaho, to Minneapolis, Minnesota, a total distance of 2,500 kilometers. You estimate you can average 100 km/hr driving within the speed limits, requiring a total of 25 hours for the trip.

A. You hear on the news that Montana has just abolished its speed limit, which constitutes 1,500 km of the trip. Your truck can travel at 150 km/hr. What will be your speedup for the trip?

$$25 / (1500 / 150 + (2500 - 1500) / 100) = 2.5x$$

B. You can buy a new turbocharger for your truck at www.fasttrucks.com. They stock a variety of models, but the faster you want to go, the more it will cost. How fast must you travel through Montana to get an overall speedup for your trip of 1.67x?

$$25 / t = 1.67, t = 15$$

$$v = 1500 / 5 = 300 \text{ km/hr}$$

Practice Problem 1.2

The marketing department at your company has promised your customers that the next software release will show a 2x performance improvement. You have been assigned the task of delivering on that promise. You have determined that only 80% of the system can be improved. How much (i.e., what value of k) would you need to improve this part to meet the overall performance target?

$$\frac{1}{0.2 + 0.8/k} = 2$$
$$k = 2.67$$

Part I: Program Structure and Execution
